Abstract. The salticid fauna of Ascension Island is discussed. Additional records of the previously recorded *Hasarius adansoni* (Audouin 1826), *Menemerus bivittatus* (Dufour 1831) and *Plexippus paykulli* (Audouin 1826) are presented and the first records of *Hentzia antillana* Bryant 1940 are made, based on specimens of both sexes. We also discuss the possible identity of '*Dendryphantes* sp.' recorded by Dahl (1892) and not found again since its first report.

Keywords. distribution, faunistic, non-native, salticid

Introduction

Ascension Island is one of the most remote inhabited islands in the world, part of the United Kingdom Overseas Territory (UKOT) of Saint Helena, Ascension and Tristan da Cunha. The spider fauna of Ascension is made up almost exclusively of non-native species (Berland 1926; Ashmole & Ashmole 1997, 2000) and most 'endemic' species have turned out to be synonyms of widespread non-native taxa (WSC 2023). Four species of the family Salticidae have been hitherto recorded: '*Dendryphantes* sp.', *Hasarius adansoni* (Audouin 1826), *Menemerus bivittatus* (Dufour 1831), and *Plexippus paykulli* (Audouin 1826) (Dahl 1892; Berland 1926; Duffey 1964; Ashmole & Ashmole 1997, 2000).

Recent samples of spiders collected by Adam Sharp and others on Ascension Island, sent to the senior author for identification, contained specimens of a species of the genus *Hentzia* Marx 1883, hitherto known only from the Caribbean region (northern South America to Southeastern United States; WSC 2023). In this work, we report *Hentzia antillana* Bryant 1940 from the South Atlantic for the first time and provide complimentary photographs of both sexes. We also discuss other species previously recorded from Ascension Island by earlier workers.

Material and methods

Specimens were examined under a binocular stereomicroscope. Images were made by the senior author using a Canon EOS 6D Mark II attached to a Leica MZ12.5 stereomicroscope, with images stacked using Helicon Focus software. Abbreviations: ASC = Ascension Island Conservation collection, Georgetown, Ascension Island (it is intended in the future that the ASC invertebrate collection will be donated and

moved to the Saint Helena National Trust, Jamestown, Saint Helena); BMNH = Natural History Museum, London, United Kingdom; coll. = collector; colln. = collection ; det. = determined by; MMUE = Manchester Museum, Manchester, United Kingdom. Salticids were commonly found mixed in tubes with other spiders particularly in the Duffey collection. However, since the species on Ascension are synanthropic and widespread this is not surprising, and we feel no need to list other spider families found in these samples in the present work as they are likely to be coincidental and not particular associations and are thus outside of its scope. In cases where two salticid species were found in one sample, the specimens of each species can be found with the same accession number under the respective species section.

Ascension faunistic records

***Hasarius adansoni* (Audouin 1826)**

Attus adansonii Audouin 1826: 404, pl. 7, f. 8 (♂♀).

For full taxonomic synonymy list, see WSC 2023.

Ashmole, 21819, J. A. Murphy and F. M. Murphy colln.

Distribution. Described by Audouin (1826) from Egypt, probably indigenous to the Middle East and Northern Africa. Introduced worldwide in the Americas, Europe and parts of South Asia, Southeast Asia, and Oceania (WSC 2023).

Remarks. A very common synanthropic species found throughout all habitat types. Duffey (1964: 242) reported *H. adansoni* as common in the arid areas of the main island, and it was found on Boatswain Bird Island by Ashmole & Ashmole (1997). This distribution is also in keeping with more recently collected specimens.

***Hentzia antillana* Bryant, 1940**

Sharp; 1 imm. (ASC G16 3 VB), Ascension Island, -7.957993, -14.350751, 507 m, 14/01/2022, coll. A. Sharp.

Distribution. Originally described based on a type series from Antigua, Cuba, Haiti and the Virgin Islands (Bryant 1940), until now thought to be a Caribbean endemic. Antigua, Ascension Island (new record), Barbuda, British Virgin Islands, Cuba, Dominican Republic, Guadeloupe, Haiti, Martinique, Montserrat, Puerto Rico, Saba, Saint Kitts and Nevis, Saint Lucia and Saint Maarten (Bryant 1940; Richman 1989; this work).

Remarks. Newly recorded from Ascension (Figures 1-2), and indeed the first records from the South Atlantic. This species was very likely introduced with air freight or by shipping.

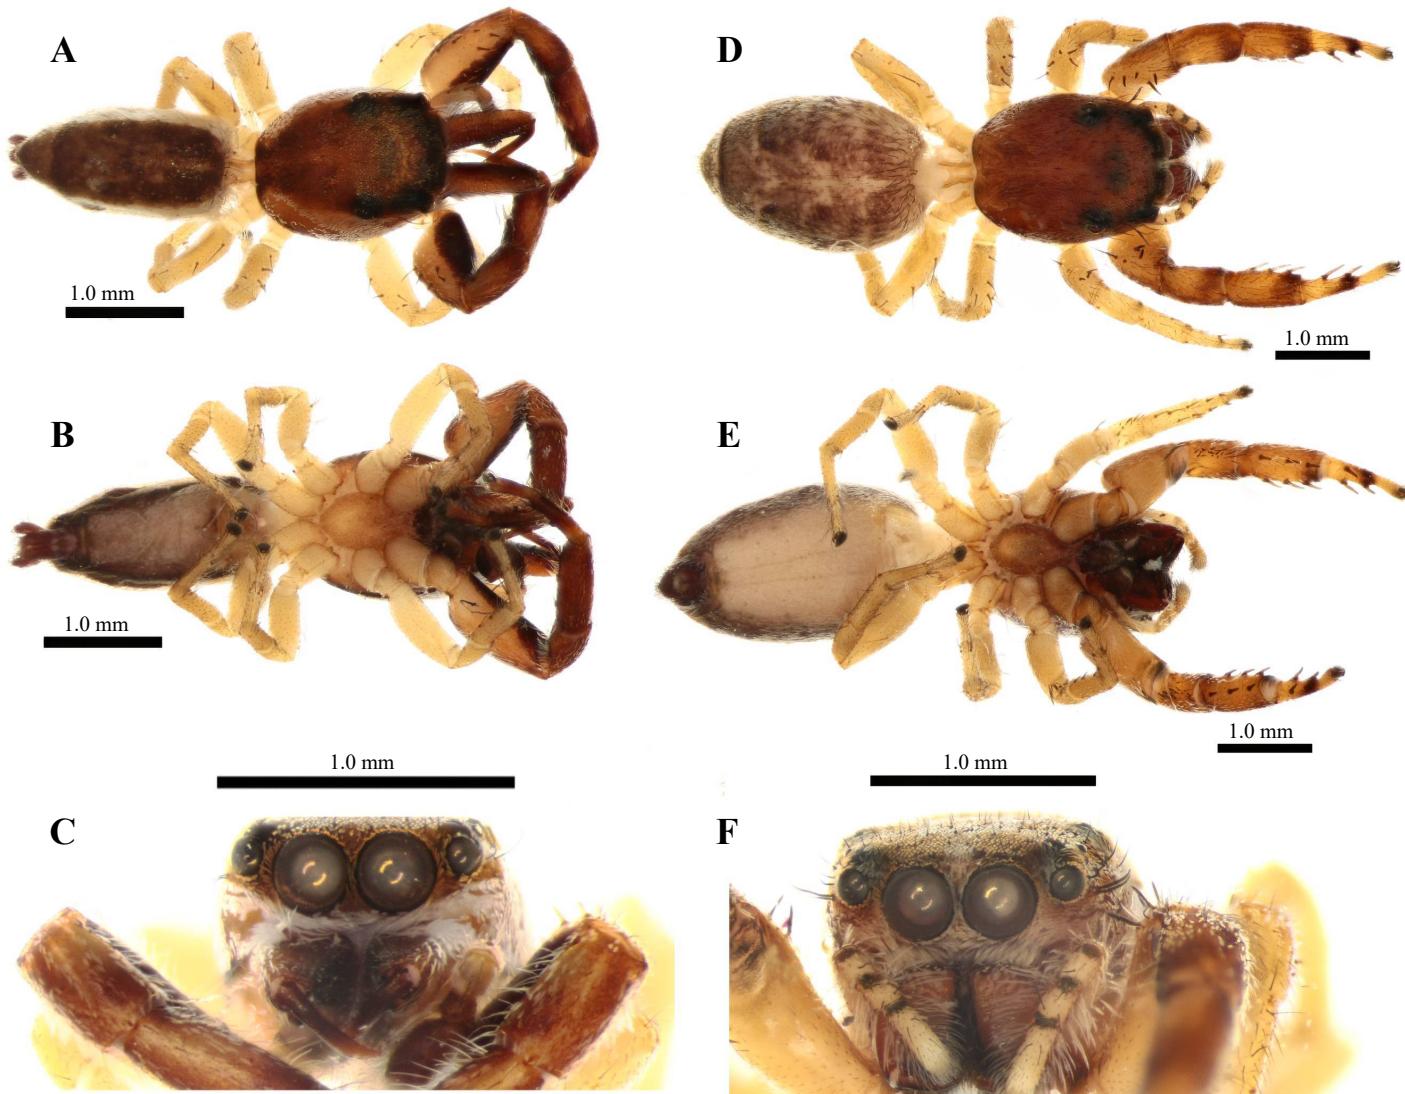

Figure 1. *Hentzia antillana* Bryant, 1940 adult male (A–C) and female (D–F) from Ascension Island. **A**, Male, habitus, dorsal. **B**, Same, ventral. **C**, Male, frontal view of eyes and chelicerae. **D**, Female habitus, dorsal. **E**, Same, ventral. **F**, Female, frontal view of eyes and chelicerae.

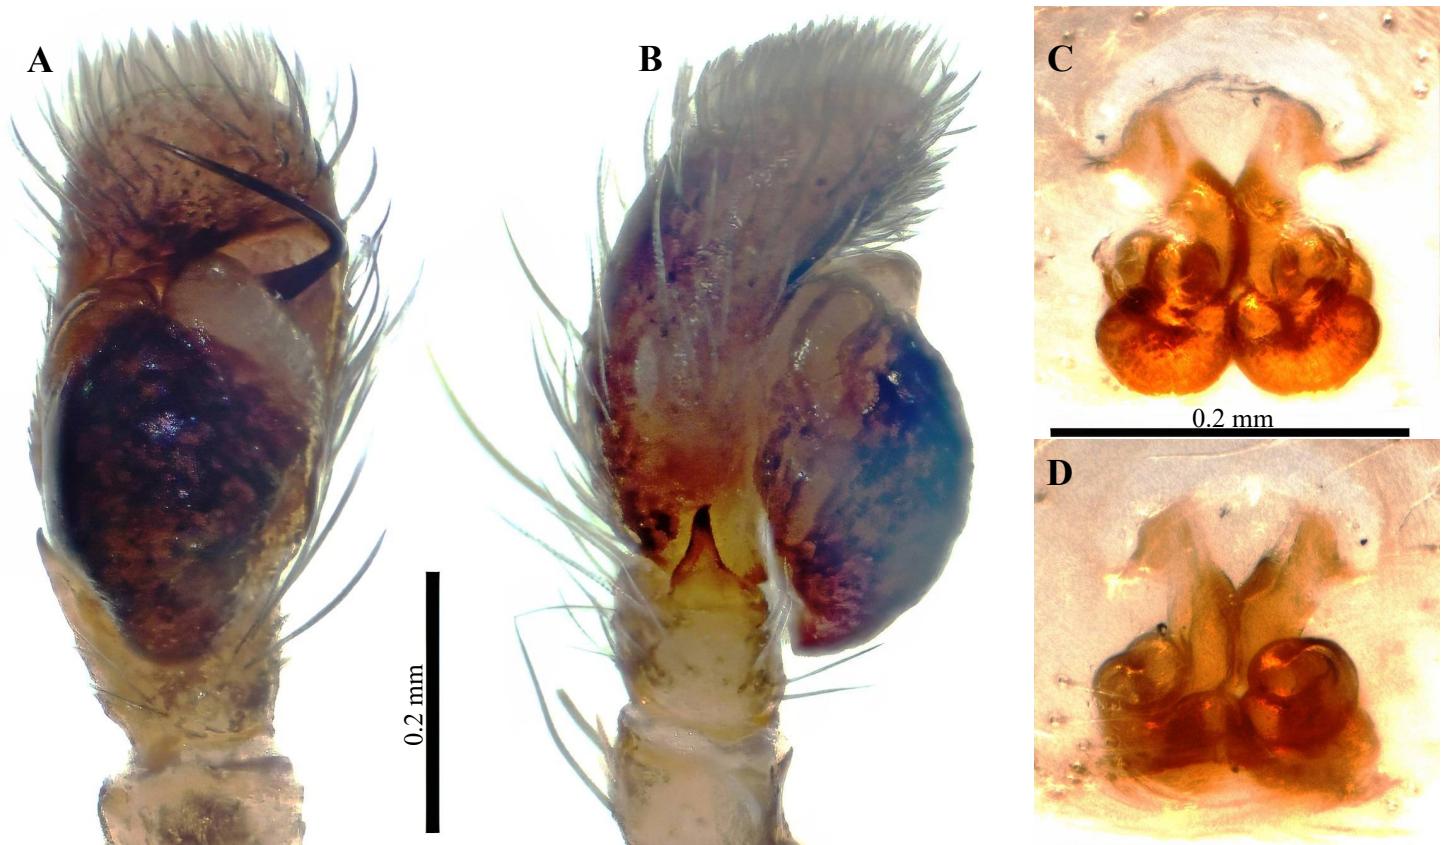

Figure 2. *Hentzia antillana* Bryant, 1940 adult male (A–B) and female (C–D) from Ascension Island. **A**, Right male palp, ventral view. **B**, Same, retrolateral view. **C**, Epigyne, ventral view. **D**, Epigyne, dorsal view.

***Menemerus bivittatus* (Dufour 1831)**

Salticus bivittatus Dufour 1831: 369, pl. 11, fig. 5 (♀).

For full synonymy list, see WSC 2023.

Material examined. 1 ♀ (ASC J15 1 PFM) Ascension Island, -7.927534, -14.343771, 137 m, 24/01/2022, coll. A. Sharp; 1 ♀ (ASC J15 1 PFF) Ascension Island, -7.927534, -14.343771, 137 m, 24/01/2022, coll. A. Sharp; 1 ♀ (ASC 00836) Ascension Island, -7.912300761, -14.40160336, 25/10/12, coll. L. F. White; 1 imm. (ASC J15 3 HPM) Ascension Island, -7.922999, -14.404769, 12 m, 18/03/2022, coll. A. Sharp; 1 ♂ (BMNH), Ascension Island, 12–31/09/1957, coll. E. A. Duffey, ‘tube 19’; 2 imm. (BMNH), Ascension Island, 12–31/09/1957, coll. E. A. Duffey, ‘tube 39’; 1 imm. (BMNH), Ascension Island, 12–31/09/1957, coll. E. A. Duffey, ‘tube Bou 44’.

Distribution. Described by Dufour (1831) from the Iberian Peninsula (as Hispania), probably indigenous to Northern Africa. Introduced worldwide in the Americas, Europe and parts of South Asia, Southeast Asia, and Oceania (World Spider Catalog, 2023).

Remarks. A reasonably common species, although not as frequently collected as *H. adansoni* and *P. paykulli* and restricted to areas of human habitation. Duffey (1964: 244) already noticed this and stated that this species: "... was only taken on or inside buildings."

Plexippus paykulli (Audouin 1826)

Attus paykullii Audouin 1826: 409, pl. 7, fig. 22 (♂).
For full taxonomic synonymy list, see WSC 2023.

(BMNH), [same data, except tube 12]; 4 imm. (BMNH), [same data, except tube 52].

Distribution. Described by Audouin (1826) from Egypt, probably indigenous to the Middle East and Northern Africa. Introduced worldwide (WSC 2023), often found in sympatry with *H. adansoni* (see above).

Remarks. A very common and widespread species. Duffey (1964: 241) reports *P. paykulli* from Boatswain Bird Island, where he found it to be abundant. He also found it throughout the mainland. These observations are in keeping with recently collected material, showing the distribution of this species has apparently not radically changed since.

Discussion

Dahl (1892), who presented the first records of spiders from Ascension, recorded '*Dendryphantes* sp.' from Ascension Island. We have seen any specimens of this genus from the island, nor has it been reported again in the published literature, and thus we cannot comment on it with any certainty. However, given that *Dendryphantes purcelli* Peckham & Peckham 1903 occurs on neighbouring Saint Helena (Clark & Benoit 1977; DS pers. obs.) this could have been the species found by Dahl. In any case, its continued existence on-island is doubtful since it has not been collected on Ascension Island for over 130 years (Duffey 1964; Ashmole & Ashmole 1997, 2000; AS pers. obs.). It is possible this [introduced?] species died out on Ascension, as happened with the Lycosidae (wolf spider) populations previously reported by Duffey (1964) (Russell-Smith & Sherwood in prep.).

Acknowledgements

We thank Wayne Maddison (Beaty Biodiversity Museum, Canada) and Galina Azarkina (Institute of Systematics and Ecology of Animals, Russia) for assistance with identification of *Hentzia antillana*. Vicky Wilkins (Species Recovery Trust and IUCN Species Survival Commission Mid-Atlantic Islands Invertebrate Specialist Group) is thanked for supporting this work and commenting on early drafts. This work was made possible by funding to the senior author through the Darwin Plus grant DPLUS135: "From pseudoscorpions to crickets: securing Ascension Island's unique invertebrates," funded by the Darwin Plus Initiative, United Kingdom Government, and administered by Ascension Island Government and supported by the Species Recovery Trust.
