EML Schema Descriptions 2

Version 4.0 3

1

24 January 2005 4

5	Document identifier:
6	EML v4.0 Schema Descriptions
7	Editor:
8	eGovernment Unit, Cabinet Office, UK
9	Contributors:
10	John Ross
11	Paul Spencer
12	John Borras
13	Farah Ahmed
14	Abstract:
15	This document contains the descriptions of the schemas used in EML v4.0. This
16	document provides an explanation of the core schemas used throughout, definitions of
17	the simple and complex datatypes, plus the EML schemas themselves. It also covers the
18	conventions used in the specification and the use of namespaces, as well as the
19	guidance on the constraints, extendibility, and splitting of messages.
20	Status:
21	This document is updated periodically on no particular schedule. Committee members
22	should send comments on this specification to the election@lists.oasis-open.org list.
23	Others should subscribe to and send comments to the election-services-
24	comment@lists.oasis-open.org. To subscribe, send an email message to election-

- 25 comment-request@lists.oasis-open.org with the word "subscribe" as the body of the 26 message. 27 For information on whether any patents have been disclosed that may be essential to 28 implementing this specification, and any offers of patent licensing terms, please refer to
- 29 the Intellectual Property Rights section of the Election and Voter Services TC web page
- 30 (http://www.oasis-open.org/committees/election/).

194 **1 Introduction**

195 This document describes the OASIS Election Mark-up Language (EML) version 4.0 schemas.

196 The messages that form part of EML are intended for transfer between systems. It is not intended 197 that all outputs of a registration or election system will have a corresponding schema.

198 This document and its accompanying set of schemas do not claim to satisfy the final

199 requirements of a registration or election system. It is incumbent on the users of this document to

identify any mistakes, inconsistencies or missing data and to propose corrections to the OASIS
 Election and Voter Services Technical Committee.

202 **1.1 Background**

203 The following is the Executive Summary of the 'EML Process & Data Requirements':

OASIS, the XML interoperability consortium, formed the Election and Voter Services Technical Committee in the spring of 2001 to develop standards for election and voter services information using XML. The committee's mission statement is, in part, to:

"Develop a standard for the structured interchange among hardware, software, and service providers who engage in any aspect of providing election or voter services to public or private organizations...."

The objective is to introduce a uniform and reliable way to allow election systems to interact with each other. The overall effort attempts to address the challenges of developing a standard that is:

- Multinational: our aim is to have these standards adopted globally

- Flexible: effective across the different voting regimes. E.g. proportional representation or 'first past the post'.

- Multilingual: flexible enough to accommodate the various languages and dialects and vocabularies.

- Adaptable: resilient enough to support elections in both the private and public sectors.

- Secure: able to secure the relevant data and interfaces from any attempt at corruption, as appropriate to the different requirements of varying election rules.

The primary deliverable of the committee the Election Mark-up Language (EML). This is a set of data and message definitions described as XML schemas. At present EML includes specifications for:

- Candidate Nomination, Response to Nomination and Approved Candidate Lists

- Voter Registration information, including eligible voter lists

- Various communications between voters and election officials, such polling information, election notices, etc.

- Logical Ballot information (races, contests, candidates, etc.)
- Voter Authentication
- Vote Casting and Vote Confirmation
- Election counts and results

- Audit information pertinent to some of the other defined data and interfaces

As an international specification, EML is generic in nature, and so needs to be tailored for specific scenarios. Some aspects of the language are indicated in EML as required for all scenarios and so can be used unchanged. Some aspects (such as the ability to identify a voter easily from their vote) are required in some scenarios but prohibited in others, so EML defines them as optional. Where they are prohibited, their use must be changed from an optional to prohibited classification, and where they are mandatory, their use must be changed from an optional to required classification.

211 **1.2 Viewing Schemas**

- 212 EML schemas are supplied as text documents. For viewing the structure of the schemas, we
- recommend use of one of the many schema development tools available. Many of these provide graphical displays.
- The Schematron schemas are mainly short and simple to understand as text documents for those with a working knowledge of XPath [4].

1.3 Schema Diagrams in this Document

- The schema diagrams in this document were created using XML Spy 2004. The following is a guide to their interpretation.
- In this section, terms with specific meanings in XML or XML Schema are shown in italics, e.g.
 sequence.
- 222 Note that the diagrams in this document do not use the default diagramming options of XML Spy,
- but have additional information. The additional information to be shown can be set using the
 menu selections Schema Design | View Config.
- In this section, and throughout this document, the prefix "xs" denotes the XML schema
 namespace http://www.w3.org/2001/XMLSchema.
- 227 The diagram below represents a simple schema. The *root element* of an *instance* described by
- this schema is the *element* A. The *content model* of this element is a *sequence* of the elements B,
- 229 D and E. The *element* B is of *complex data type* Bstructure. This contains a *choice* of either
- element C or element F. Element C is a restriction of another complex data type Cstructure. In
- this case, the restriction is to forbid the use of the *element* G (which is defined in Cstructure as
- optional). The other *elements* allowed are H, which can appear any number of times (but must
 appear at least once), and I, which can appear up to three times (or not at all). *Element* D is
- optional, and of *data type* Dstructure. This has a *content model* requiring *all* of *elements* J and
- 235 K, which are both of *type* xs:string. Finally, *element* E is of *simple data type* Etype, which is
- 236 restricted from the xs: NMTOKEN data type by only allowing the values 'yes' and 'no'.
- 237 It is important to remember that these diagrams do not include any *attributes*. In this document,
- these are shown in tables below the diagrams.

239 The full schema is shown below the diagram.

```
268
                <xs:complexContent>
269
                  <xs:restriction base="Cstructure">
270
                     <xs:sequence>
271
                       <xs:element name="G" type="xs:positiveInteger"</pre>
272
      minOccurs="0" maxOccurs="0"/>
273
                       <xs:element name="H" type="xs:string"</pre>
274
     maxOccurs="unbounded"/>
275
                       <xs:element name="I" type="xs:date" minOccurs="0"</pre>
276
      maxOccurs="3"/>
277
                     </xs:sequence>
278
                  </xs:restriction>
279
                </xs:complexContent>
280
              </xs:complexType>
281
            </xs:element>
282
            <xs:element ref="F"/>
283
          </xs:choice>
284
        </xs:complexType>
285
        <xs:complexType name="Cstructure">
286
          <xs:sequence>
287
            <xs:element name="G" type="xs:positiveInteger" minOccurs="0"/>
288
            <xs:element name="H" type="xs:string" maxOccurs="unbounded"/>
289
            <xs:element name="I" type="xs:date" minOccurs="0" maxOccurs="3"/>
290
          </xs:sequence>
291
        </xs:complexType>
292
        <xs:complexType name="Dstructure">
293
          <xs:all>
294
            <xs:element name="J" type="xs:string"/>
295
            <xs:element name="K" type="xs:string"/>
296
          </xs:all>
297
        </xs:complexType>
298
        <xs:element name="F" type="xs:string"/>
299
      </xs:schema>
```

300 **1.4 EML Message Validation**

It is up to each specific system implementation whether it uses these schemas for validation of EML messages for either testing or live use. The recommended approach is to validate incoming messages against the EML schemas (with the application-specific EML externals schema), then further validate against the relevant Schematron schema. The first stage requires the use of an XML processor (parser) that conforms to W3C XML Schema. The second stage requires either an XSLT processor or a dedicated Schematron processor.

- 307 However, an implementation may choose to:
- modify the EML schemas to incorporate those application-specific constraints that can be represented in W3C XML Schema;
- not validate the rules that are encoded as Schematron schemas;
- not perform any validation; or
- develop some alternative validation.

313 **1.5 Namespaces**

- 314 The message schemas and the core schema are associated with the namespace
- 315 urn:oasis:names:tc:evs:schema:eml. This is defined using the prefix eml. The XML
- 316 Schema namespace http://www.w3c.org/2001/XMLSchema is identified by the prefix xs and
- 317 the XML Schema Instance namespace http://www.w3.org/2001/XMLSchema-instance by
- 318 the prefix xsi.

- 319 Use is also made of namespaces for the Extensible Name and Address Language (xNAL). The
- 320 Extensible Name Language namespace urn:oasis:tc:ciq:xsdschema:xNL:2.0 is
- 321 identified by the prefix xnl, and the Extensible Language namespace
- 322 urn:oasis:names:tc:ciq:xsdschema:xAL:2.0 by the prefix xal.

323 **1.6 Extensibility**

Various elements allow extensibility through the use of the xs:any element. This is used both for display information (for example, allowing the sending of HTML in a message) and for local extensibility. Note that careless use of this extensibility mechanism could reduce interoperability.

327 **1.7 Additional Constraints**

The EML schemas provide a set of constraints common to most types of elections worldwide. Each specific election type will require additional constraints, for example, to enforce the use of a seal or to ensure that a cast vote is anonymous. It is recommended that these additional constraints be expressed using the Schematron language. This allows additional constraints to be described without altering or interacting with the EML schemas. Any document that is valid to a localization expressed in Schematron must also be a valid EML document.

1.8 Conventions

335 Within this specification, the following conventions are used throughout:

- Diagrams are shown as generated by XML Spy 2004 which was also used to generate the
 schemas and samples. These diagrams show element content, but not attributes
- Elements and attributes in schemas are identified by partial XPath expressions. Enough of a pathis used to identify the item without putting in a full path.

340 **2 Processing using Schematron**

This section gives a short introduction to how validation can be achieved using Schematron
 schemas and an XSLT processor. Alternatively, direct validation using the Schematron schemas
 can be achieved using a dedicated Schematron processor.

344 **2.1 Validation using the Schematron Schemas**

345 A Schematron schema is an XML document that can be converted to XSLT using an XSLT

stylesheet. There is a published stylesheet (skeleton1-5.xslt) that can be used to achieve this.
This produces an HTML output from the validation. A separate stylesheet can be produced that
will create an output to the specification below. This stylesheet can import the skeleton and just
over-ride those aspects where changes are required.

350 This stylesheet can be used once on each Schematron schema to produce the XSLT file that will

351 be used for validating a specific message type. This stylesheet is then used to transform the

352 incoming EML message into an error report based on the additional constraints.

353 The process is shown in the diagram below.

356 **3 Splitting of Messages**

There is sometimes a need to split long messages into several parts. By their nature, each of these messages will contain a small amount of background information and a single element type that is repeated many times. For example, the 330-electionlist message can have many VoterDetails elements.

When a message is split, each part must be a complete, valid message. This will contain all the background information with a number of the repeated element types. Information in the EML element indicates the sequence number of the message and the number of messages in the sequence. Each message in the sequence must contain the same TransactionId, and must indicate the repeated element according to the table below. Only the messages shown in the

table may be split in this way.

Message	Repeated Element	
330-electionlist	VoterDetails	
340-pollinginformation	Polling	
410-ballots	Ballot	
460-votes	CastVote	
470-vtokenlog	VTokens	
480-auditlog	LoggedSeal	

367 For ease of implementation, a message that can be split may contain the elements used for

368 splitting even if the entire message is sent in one piece. In this case, the values of

369 SequenceNumber and NumberInSequence will both be "1".

370 4 Error Messages

- The 130 schema is used to define a message for reporting errors in EML messages.
- 372 Error messages are given codes. These fall into one of five series:

1000	XML well-formedness or Schema validation error	
2000	Seal error	
3000	EML rule error	
4000	Localization rule error	
5000	System specific error	

373 If the error type is not message-specific (or is a general rule applying to several schemas), the

374 series reference above is used. If it is message-specific, the last three digits of the error series 375 (and possibly a final alpha character) reflect the message type. A three digit error code is

376 appended to the series code, separated by a hyphen.

377 An error code relating to a localization applicable to all message types could therefore be 4000-

378 001. One specific to the localization of schema 110 could be 4110-002.

379 4.1 All Schemas

380

4.1.1 XML well-formedness or Schema validation error

Error code	Error Description	
1000-001	Message is not well-formed	
1000-002	1000-002 Message is not valid	

381

4.1.2 Seal Errors

Error code	Error Description	
2000-001	The Seal does not match the data	

382

4.1.3 EML Additional Rules

The following rules apply to messages regardless of localization. One of the two rules on splitting will apply to each message type as described in the table below.

Error Code	Error Description	
3000-001	If there are processing units in the AuditInformation, one must have the role of sender	
3000-002	If there are processing units in the AuditInformation, one must have the role of receiver	

3000-003	This message must not contain the elements used for splitting	
3000-004	The value of the Id attribute of the EML element is incorrect	
3000-005	The message type must match the Id attribute of the EML element	
3000-006	All messages that are split must include the correct sequenced element name.

386 5 EML Core Components

The core schema contains elements and data types that are used throughout the e-votingschemas.

389 To help message schema diagrams fit on the page, these elements and data types are not

390 expanded each time they appear in other diagrams.

391 The following schema components are defined in the EML core.

Elements	Complex Data Types	Simple Data Types
Accepted	AffiliationIdentifierStructure	ConfirmationReferenceType
Affiliation	AffiliationStructure	CountingAlgorithmType
AffiliationIdentifier	AgentIdentifierStructure	DateType
Agent	AgentStructure	EmailType
AgentIdentifier	AreaStructure	ErrorCodeType
Area	AuditInformationStructure	GenderType
AuditInformation	AuthorityIdentifierStructure	LanguageType
AuthorityIdentifier	BallotIdentifierRangeStructure	MessageTypeType
BallotIdentifier	BallotIdentifierStructure	SealUsageType
BallotIdentifierRange	CandidateIdentifierStructure	ShortCodeType
Candidate	CandidateStructure	TelephoneNumberType
CandidateIdentifier	ComplexDateRangeStructure	VotingChannelType

392 **5.1 Simple Data Types**

393 The simple data types are included here with their base data types and any restrictions applied.

5.1.1 ConfirmationReferenceType

395 xs:token.

394

396 The reference generated once the confirmation of a vote has been completed.

397 **5.1.2 CountingAlgorithmType**

- 398 xs:token
- 399 The method of counting used for more complex forms of election.

400 **5.1.3 DateType**

- 401 Union of xs:date and xs:dateTime
- There are several possible dates associated with an election. Some of these can be either just a date or have a time associated with them. These can use this data type.

404 **5.1.4 EmailType**

- 405 xs:token with restrictions.
- 406
 Restrictions:
 xs:maxLength:
 129

 407
 xs:pattern:
 [^@]+@[^@]+

- 408 This type is a simple definition of an email address, pending a more complete description that is
- 409 widely accepted in industry and government. It allows any characters except the @ symbol,
- 410 followed by an @ symbol and another set of characters excluding this symbol.

411 **5.1.5 ErrorCodeType**

- 412 xs:token
- 413 One of a pre-defined set of error codes as described in the section "Error Messages".

414 **5.1.6 GenderType**

- 415 xs:token with restrictions.
- 416 Restrictions: xs:enumeration: male, female, unknown
- 417 The gender of a voter or candidate. Options are male, female or unknown (unknown is not allowed in all contexts).

419 **5.1.7 LanguageType**

- 420 xs:language
- 421 Declaration of the type of language used in the election.

422 **5.1.8 MessageTypeType**

- 423 xs:NMTOKEN
- This is the alphanumeric type of the message (e.g. 440 or 350a). This may be required for audit purposes.

426 **5.1.9 SealUsageType**

- 427 xs:NMTOKEN with restrictions.
- 428 Restrictions: xs:enumeration: receiver, sender
- 429 Indicates whether a device logging a seal was the sender or receiver of the seal.

430 5.1.10 ShortCodeType

431 xs:NMTOKEN

438

432 This identifies an aspect of the election (such as a contest or candidate) when voting using SMS 433 or other voting mechanisms where a short identifier is required.

434 **5.1.11 TelephoneNumberType**

- 435 xs:token with restrictions.
- 436 Restrictions: xs:maxLength: 35
- 437 xs:minLength: 1

xs:pattern: \+?[0-9\(\)\-\s]{1,35}

- 439 Since this must allow for various styles of international telephone number, the pattern has been
- 440 kept simple. This allows an optional plus sign, then between 1 and 35 characters with a
- combination of digits, brackets, the dash symbol and white space. If a more complete definition
 becomes widely accepted in industry and government, this will be adopted.

443 **5.1.12 VotingChannelType**

444 xs:token with restrictions.

- 445 Restrictions: xs:enumeration: SMS, WAP, digitalTV, internet, kiosk, polling, postal, 446
 - telephone, other
- 447 This type exists to hold the possible enumerations for the channel through which a vote is cast.
- 448 SMS is the Short Message Service (text message). WAP is the Wireless Access Protocol.
- 449 If other is used, it is assumed that those managing the election will have a common
- 450 understanding of the channel in use.

5.1.13 VotingMethodType 451

452 xs:token with restrictions.

- 453 Restrictions: xs:enumeration: AMS, FPP, OPV, SPV, STV, approval, block, partylist, 454 supplementaryvote, other
- The VotingMethod type holds the enumerated values for the type of election (such as first past 455 the post or single transferable vote). The meanings of the acronyms are: 456
- 457 AMS – Additional Member System
- 458 • FPP - First Past the Post
- 459 **OPV - Optional Preferential Voting**
- 460 SPV - Single Preferential Vote
- 461 • STV - Single Transferable Vote

5.1.14 VotingValueType 462

463 xs:positiveInteger.

464 Indicates a value assigned when voting for a candidate or referendum option. This might be a weight or preference order depending on the election type. 465

5.1.15 YesNoType 466

467 xs:token with restrictions.

- 468 Restrictions: xs:enumeration: no, yes
- 469 This is a simple enumeration of yes and no and is used for elements and attributes that can only 470 take these binary values.

5.2 Complex Data Types 471

472 The choice between defining an element or a data type for a reusable message component is a 473 significant design issue. It is widely accepted as good practice to use element declarations when there is good reason to always refer to an element by the same name and there is no expectation 474 of a need to derive new definitions. In all other cases, data type declarations are preferable. The 475

term schema component is used to refer to elements and data types collectively. 476

477 When defining a complete mark-up language, limiting the use of elements and types can restrict 478 further development of the language. For that reason, both data types and elements are defined in EML. Only where an element is an example of a primitive or derived data type defined in XML 479

- 480 Schema part 2 is no explicit data type defined within EML.
- 481 In use, it is expected that, for example:
- 482 A voting token will always have an element name VToken and so will use the element 483 name:

- A logo or a map have similar definitions, so both use the PictureDataStructure.
- 485 There is no PictureData element.

Within voter identification, some elements will usually need to be made mandatory and so
 a schema will specify a new element based on the VoterIdentificationStructure
 data type.

5.2.1 AffiliationIdentifierStructure

489

Element	Attribute	Туре	Use	Comment
AffiliationIdentifierStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
	ShortCode	ShortCodeType	optional	
	ExpectedConfirmationReference	ConfirmationReferenceType	optional	

491 This data type is used to identify an affiliation, such as a political party. The identifier indicates the 492 official name and ID of the organization. It supports use of a short code for voting systems such

493 as SMS, and an expected confirmation reference for security systems that require this.

494

5.2.2 AffiliationStructure

495

AffiliationStructure data type indicates membership of some organization such as a political party. The description will normally be used to indicate the name usually associated with the organization, and so is the value that will usually be shown on a ballot. An organization may indicate several logos, each with a rôle. For example, one rôle might indicate that the logo should be used on a ballot paper. Each logo can be identified by a URL or sent as a Base64 encoded binary value. In the latter case, the format of the logo (BMP, TIFF, PNG, GIF or JPEG) must be indicated.

503

5.2.3 AgentIdentifierStructure

- 504
- 505

AgentidentifierStructure	Age	entName]
Ingentidentiller of detaile	type	PersonNameStructure	Ï

Element	Attribute	Туре	Use	Comment
AgentIdenttifierStructure	ld	xs:NMTOKEN	optional	

DisplayOrder	xs:positiveInteger	optional	
--------------	--------------------	----------	--

506 The agent identifier contains a name and ID. The data type for the name is localized using the 507 EML externals schema.

508

5.2.4 AgentStructure

509

Element	Attribute	Туре	Use	Comment
AgentStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
	Role	xs:token	optional	

510 A candidate in an election can have one or more agents, each agent having a specific rôle,

identified by the Role attribute. For example, an agent may be allowed access to the count, but

512 not to amend details of the candidate.

513 The agent has an identifier, comprising a name and ID, and an affiliation. He or she also has an

514 official address and a standard set of contact details.

515 5.2.5 AreaStructure

⁵¹⁶ The AreaStructure is an extension of xs:token to add the following attributes:

Element	Attribute	Туре	Use	Comment
AreaStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
	Туре	xs:token	optional	

517 This data type is used to define elements defining the geographical area covered by a contest.

518 The Type attribute is used to indicate the type of area, such as "county".

5.2.6 AuditInformationStructure

520

Element	Attribute	Туре	Use	Comment
Other	Role	xs:token (restricted)	required	Standard attribute for a ProcessingUnitStructure
	Туре	xs:token	required	Additional attribute for this element

521 The AuditInformationStructure is used to define an element to provide information for audit 522 purposes. It allows the voting channel in use to be described, with the identities of those devices 523 that have participated in the message being sent. Each device has an attribute to describe its rôle

524 (see ProcessingUnitStructure).

525 Where a device does not fit any of the categories here, it can be described as Other with the 526 addition of a Type attribute.

527 **5.2.7 AuthorityIdentifierStructure**

528 The AuthorityIdentifierStructure is an extension of xs:token to add the following 529 attributes:

Element	Attribute	Туре	Use	Comment
AuthorityIdentifierStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	

530 This data type defines information to identify an election authority. This may include a system ID

and text description.

5.2.8 BallotIdentifierStructure

534

535

536

Element	Attribute	Туре	Use	Comment
BallotIdentifierStructure	ld	xs:NMTOKEN	required	
	DisplayOrder	xs:positiveInteger	optional	

This data type is used to define an element that is an identifier for a ballot. This will usually use 537 538 the Id attribute as the identifier, but might use a name to indicate a set of identical ballots. 539 Elements using this data type will usually only be used for paper ballots.

Element	Attribute	Туре	Use	Comment
BallotIdentifierRangeStructure	Colour	xs:token	optional	

549

This data type is used to define an element that identifies a range of ballots. This might be used, 550

for example, to assign ranges of ballot identifiers to different reporting units for a contest. It is 551

552 unlikely that the ballot name would be used when defining range, the Id attribute being used

instead. Elements using this data type will usually only be used for paper ballots. 553

554

5.2.10 CandidateIdentifierRangeStructure

Element	Attribute	Туре	Use	Comment
CandidateIdentifierStructure	ld	xs:NMTOKEN	required	
	DisplayOrder	xs:positiveInteger	optional	
	ShortCode	ShortCodeType	optional	
	ExpectedConfirmationReference	ConfirmationReferenceType	optional	

- 556 The candidate identifier indicates a system ID for the candidate and the candidate's name as it
- will appear in a ballot. Sometimes an additional line is required on the ballot to help identify the
- 558 candidate. This will use the KnownAs element of the candidate identifier. A short code can also be
- 559 included, either for SMS voting or where the security mechanism in place requires it. An
- 560 ExpectedConfirmationReference attribute also allows for security mechanisms where the
- 561 confirmation reference may be different for each combination of voter and candidate.

5.2.11 CandidateStructure

Element	Attribute	Туре	Use	Comment
CandidateStructure	Independent	YesNoType	optional	
	DisplayOrder	xs:positiveInteger	optional	

564 The candidate description includes all the information required about the candidate. In different

565 messages, the amount of information is reduced, either by restricting the information in EML or as 566 part of a localization.

567 The candidate has an identifier. The full name of the candidate may also be provided, and

568 whether the candidate is an independent. This is supplied as an attribute rather than affiliation as 569 certain election types treat independents differently from other candidates, even though they may

570 define an affiliation.

571 The candidate profile describes the candidate. The election statement describes the opinions of

the candidate. Optionally, a photo may be included, either as a link or as Base64 encoded binary.

573

5.2.12 ComplexDateRangeStructure

574

Element	Attribute	Туре	Use	Comment
ComplexDateRangeStructure	Туре	xs:token	required	

575 This data type is used to describe ranges of dates or dates and times. Each date can be a single 576 date, a start date, an end date or include both start and end dates.

577 The Type attribute is used to indicate the purpose of the date (e.g. "deadline for nominations"). It

578 is likely that this will be removed before release of EML version 4 and applied to elements instead 579 as an extension of this data type.

5.2.13 ContactDetailsStructure

581

Element	Attribute	Туре	Use	Comment
ContactDetailsStructure	DisplayOrder	xs:positiveInteger	optional	

582 This data type is used in many places throughout the EML schemas. The mailing address uses 583 whatever format is defined in the EML externals schema document. Where several addresses or 584 numbers can be given (for example, email addresses), there is a facility to indicate whichever is

585 preferred. The overall preferred method of contact can also be provided by placing an XPath to

586 the preferred method in the PreferredContact element.

587

588

5.2.14 ContestIdentifierStructure

ContestIdentifierStructure		ConteetName
	ىرى ب	type xs:token

Element	Attribute	Туре	Use	Comment
ContestIdentifierStructure	ld	xs:NMTOKEN	required	
	DisplayOrder	xs:positiveInteger	optional	
	ShortCode	ShortCodeType	optional	

589 This data type is used to define an element that is an identifier for a contest. It holds a name and 590 ID. A short code can also be included, for example, for SMS voting.

5.2.15 DocumentIdentifierStructure

592 The DocumentIdentifierStructure is an extension of xs:token to add the following

593 attribute:

Element	Attribute	Туре	Use	Comment
DocumentIdentifierStructure	Href	xs:anyURI	required	

594

595 This allows identification of external documents relating to an event, election or contest. The 596 document can have a name and URL.

5.2.16 ElectionGroupStructure 597

598 The ElectionGroupStructure is an extension of xs:token to add the following attribute:

Element	Attribute	Туре	Use	Comment
DocumentIdentifierStructure	ld	xs:token	required	

599 The election group is used to group a number of elections together. This could be required, for

example, under the additional member system, where two elections are held, the result of one 600

601 influencing the result of the other. It could also be used at a company AGM, where proposals might be grouped for display purposes. 602

603

5.2.17 ElectionIdentifierStructure

604

Element	Attribute	Туре	Use	Comment
ElectionIdentifierStructure	ld	xs:NMTOKEN	required	
	DisplayOrder	xs:positiveInteger	optional	
	ShortCode	ShortCodeType	optional	

605 The election identifier is used wherever the election needs to be specified. There is an Id

606 attribute, which can often be used on its own to identify the election. In other cases, particularly

607 where the content of a message is to be displayed, the election name can also be provided. The 608 election group is used to group a number of elections together as described above.

609 The election category is used in messages where several elections are included in the message,

610 but may be treated differently under localisation rules. Each election that requires different

611 treatment will be given a category unique within that election event, allowing a Schematron

processor to distinguish between the elections. 612

613 5.2.18 EmailStructure

614 The EmailStructure is an extension of the EmailType to add the following attribute:

Element	Attribute	Туре	Use	Comment
EmailStructure	Preferred	YesNoType	optional	

615 The Preferred attribute is used to distinguish which of several email addresses to use.

616 **5.2.19 EMLstructure**

617

Element	Attribute	Туре	Use	Comment
EMLstructure	ld	MessageTypeType	required	
	SchemaVersion	xs:NMTOKEN	requried	
	ShortCode	ShortCodeType	optional	
Stylesheet	Туре	xs:token	required	

The EML element defined by this data type forms the root element of all EML documents. The transaction ID is used to group messages together, for example, when they are split using the

620 message splitting mechanism. This mechanism is implemented using the next three elements.

The optional message language indicates the language of the message using ISO 639 three

622 letter language codes, while the requested response language can be used to indicate the

623 preferred language for a response. This element is used in messages from the voter or candidate 624 to the election organizers.

The display element allows the definition of stylesheets to display the message. Multiple

626 stylesheets can be declared. When displaying on the web, the first is likely to be an XSLT

stylesheet, while the second might describe a CSS stylesheet to be incorporated as well. The
Type attribute of the Stylesheet element should contain a media types as defined in RFC 2046
Pt 2 [1] using the list of media types defined by IANA [2], for example, text/xsl. The final element
defined is the seal, which is used to seal the complete message.

5.2.20 EventIdentifierStructure

632

631

Element	Attribute	Туре	Use	Comment
EventIdentifierStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	

633 The event identifier is used wherever the election event needs to be specified. There is an Id 634 attribute, which can often be used on its own to identify the event. In other cases, particularly 635 where the content of a message is to be displayed, the event name can also be provided. The

636 event qualifier is used to further identify the event.

637 5.2.21 EventQualifierStructure

638 The EventQualifierStructure is an extension of xs:token to add the following attribute:

Element	Attribute	Туре	Use	Comment
EventQualifierStructure	ld	xs:NMTOKEN	optional	

The event qualifier is used to further identify the event. For example, there might be "County"

640 Elections" covering an entire country, but the events are organized at a county level, so the event

641 qualifier would identify the county.

5.2.22 IncomingGenericCommunicationStructure

- 644 This data type provides a common structure for incoming communications. Individual message
- 645 types, such as that used for selecting a preferred voting channel (schema 360b) are based on
- 646 extensions of this type.

5.2.23 InternalGenericCommunicationStructure

648

- 649 This data type provides a common structure for communications between entities involved in the
- organization of an election. Individual message types are based on extensions of this type. The
- sender and recipient can use any elements defined within EML.

652 5.2.24 LogoStructure

653 The LogoStructure is an extension of the PictureDataStructure to add one attribute:

Element	Attribute	Туре	Use	Comment	
LogoStructure	ld	xs:NMTOKEN	optional	Standard attribute for a PictureDataStructure	
	DisplayOrder	xs:positiveInteger	optional	Standard attribute for a PictureDataStructure	
	Role	xs:token	optional	Additional attribute for this element	

This element extends the picture data structure by adding an attribute to define the rôle of the

logo. This can be used to indicate the purpose of the logo (for example, it is to appear on a ballot).

5.2.25 ManagingAuthorityStructure

658

The managing authority is the body responsible for an election event, election, contest or

reporting unit. In most cases, not all of these will be required, but sometimes more than one is necessary. For example, an election using the additional member system might be organized on a regional basis, whilst local authorities organise their local election events. In this case, the region becomes the managing authority for the contest, whilst the local authority is the managing authority for the event. There will also be an authority responsible for the overall conduct of the election, although this information might not be required.

666 The managing authority indicates the authority name, address, Id, any logo that might be required 667 for display during the election and a list of responsible officers.

5.2.26 MessageStructure

669

668

1.10 0.00						
Element	Attribute	Туре	Use	Comment		
MessagesStructure	DisplayOrder	xs:positiveInteger	optional			
Message	Format	xs:topken	optional			
	Туре	xs:token	optional			
	Lang	LanguageType	optional			

The Message element is of 'mixed' type, so can have both text and element content. The

671 intention is that it should have one or the other. The Message element has three attributes: Lang

672 is used to indicate the language of the message using ISO 639 three letter language codes,

673 Format indicates the format of element content using the media types definition from RFC 2046

Pt 2 [1] and the list of media types defined by IANA [2], for example, text/html, and Type indicates

the purpose of the message.

676

5.2.27 NominatingOfficerStructure

- The nominating officer is the person nominating a party in an election run under, for example, the
- 679 party list system. The data type includes a name and contact information.

5.2.28 OutgoingGenericCommunicationStructure

681

682 This data type provides a common structure for communications from electoral service organisers

to voters. Multiple voters can be identified to allow printing of messages. Individual message
 types, such as that used for offering voting channel options (360a) are based on extensions of

685 this type.

5.2.29 PeriodStructure

687

688 This element can be used when appointing a proxy or registering to vote using a specific channel

689 (e.g. postal). It allows this registration to be for a period of time, for specific election events (and

690 possibly elections within those events) or permanently.

691 **5.2.30 PictureDataStructure**

692

Element	Attribute	Туре	Use	Comment
PictureDataStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
Binary	Format	xs:NMTOKEN (restricted)	required	

693 Where a picture (logo, map, photo) is provided, it may be given as either a link or as Base64

694 encoded binary data. In the latter case, the format of the logo (bmp, gif, jpeg, png or tiff) must be

695 indicated using the Format attribute of the Binary element.

5.2.31 PollingDistrictStructure

697

Element	Attribute	Туре	Use	Comment
PollingDistrictStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	

The polling district indicates where a voter is registered to vote. The polling district can have a

name and an Id attribute. It can also be associated with other terms such as a constituency. This

700 is done through the Association element, which has Type attribute and may have an Id

701 attribute as well as a text value.

702 5.2.32 PollingPlaceStructure

Element	Attribute	Туре	Use	Comment
PollingPlaceStructure	Channel	VotingChannelType	required	
	DisplayOrder	xs:positiveInteger	optional	
PhysicalLocation	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
PostalLocation	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
ElectronicLocation	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
OtherLocation	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
PollingStation	ld	xs:NMTOKEN	optional	

In general, a polling place will be either a physical location (for paper or kiosk voting), a postal address (for postal votes) or an electronic location (for Internet, SMS, telephone and other electronic means of voting). However, it is possible that none of these types will meet every need, and so an OtherLocation element has been included. Each of these locations must indicate the channel for which it is to be used. If a single location supports multiple channels, it must be included multiple times.

A physical location has an address. Sometimes, several polling stations will be at the same

address, so a polling station can be defined by name and/or Id within the address. Access to an
 external map can also be provided as a URI or Base64 encoded binary data.

712 external map can also be provided as a ORI of Baseo4 encoded binary data.

An electronic location must indicate its address (e.g. phone number, URL).

714 An optional TimeAvailable element is also provided. In most cases, this is not required as the

time a location is available is the same as the time the channel is available. However, there are

circumstances, such as the use of mobile polling stations, where this is not the case.

717 **5.2.33 PositionStructure**

718 The PositionStructure is an extension of xs:token to add the following attributes:

Element	Attribute	Туре	Use	Comment
PositionStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	

The element defined by this type indicates the position (e.g. President) for which an election is being held. It has a text description and an optional ID.
5.2.34 ProcessingUnitStructure

722

Element	Attribute	Туре	Use	Comment
ProcessingUnitStructure	Role	xs:token (restricted)	required	

A processing unit is a physical system used in the election process. It is identified as part of audit information by its ID (which might be an IP address) and optional name.

725 Each processing unit has an attribute to describe its rôle. The rôle can be "sender", "receiver",

726 "previous sender" or "next receiver". The latter two are used when there is a gateway involved.

727 For example, a 440 (cast vote) message might have an OriginatingDevice as its original

sender, a gateway as sender and voting system as receiver.

729

5.2.35 ProposalldentifierStructure

730

Element	Attribute	Туре	Use	Comment
ProposalldentifierStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
	ShortCode	ShortCodeType	optional	
	ExpectedConfirmationReference	ConfirmationReferenceType	optional	

A proposal is used in a referendum. At a basic level, it is a piece of text with the options ('yes' and

732 'no', 'for' and 'against' etc) to be voted on.

733 The proposal identifier indicates a system ID for the proposal. A short code can also be included,

rither for SMS voting or where the security mechanism in place requires it. An

735 ExpectedConfirmationReference attribute also allows for security mechanisms where the

confirmation reference may be different for each combination of voter and candidate.

737 5.2.36 ProposalStructure

738

24 January 2005 Page 37 of 94

Element	Attribute	Туре	Use	Comment
ProposalStructure	Туре	xs:token	optional	

The proposal identifier provides a name and ID. The description is used to provide the information that will be displayed to the voter to indicate the aim of the proposal. The options are then used to indicate how the voter may vote.

742 The Type attribute allows for referenda where there are different kinds of proposal, for example,

743 'initiative' or 'referendum'.

744 **5.2.37 ProposerStructure**

745

Element	Attribute	Туре	Use	Comment
ProposerStructure	Category	xs:token (restricted)	optional	

A proposer proposes, seconds or endorses a candidate or referendum proposal. A proposer can

have a category, which indicates one of "primary", "secondary" or "other". A name is always
 required, and additional information might be needed.

5.2.38 ProxyStructure

749

750

Element	Attribute	Туре	Use	Comment
ProxyStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
PreferredChannel	Fixed	YesNoType	optional	

In many elections, a voter may appoint a proxy to vote on his or her behalf. That proxy may be

identified by position (for example, appointing the chairman as proxy at a company AGM), or by

name (for example, appointing your spouse as proxy for a public election), or both.

In some elections, the proxy must, for example, be a family member. This is indicated using the

- 755 Qualification element, while a reason for appointing a proxy can be indicated using the756 Reason element.
- 757 A proxy can be permanent (i.e. appointed until revoked), appointed for one or more election
- rts events (and individual elections within each event) or for a period of time. A proxy can also list his
- or her preferred voting channels. These are listed in order of preference for a given period (which
- 760 may be specific election events, a date range or permanent), so that information can be sent
- regarding the most appropriate voting channel at any election. The channel may be fixed, for
- example, if registering to vote by a specific channel prevents voting by other means.
- A proxy may also have a voting token, indicating the right to vote, or a qualified voting token, indicating that there is a question over their right to vote.
- 765

5.2.39 ReferendumOptionIdentifierStructure

766 The ReferendumOptionIdentifierStructure is an extension of xs:token to add the 767 following attributes:

Element	Attribute	Туре	Use	Comment
ReferendumOptionIdentifierStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
	ShortCode	ShortCodeType	optional	
	ExpectedConfirmationReference	ConfirmationReferenceType	optional	

- A referendum option is used to indicate the possible answers to a referendum question, such as
- 769 "yes" and "no" or "for" and "against".

The referendum option identifier has a text description and can have a system ID. A short code

can also be included, either for SMS voting or where the security mechanism in place requires it.

772 An ExpectedConfirmationReference attribute also allows for security mechanisms where the

confirmation reference may be different for each combination of voter and option.

774 **5.2.40 ReportingUnitIdentifierStructure**

775 The ReportingUnitIdentifierStructure is an extension of xs:token to add the following 776 attributes:

Element	Attribute	Туре	Use	Comment
ReportingUnitIdentifierStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	

A reporting unit is an entity that reports partial information relating to a contest (votes or the

results of a count) without having the full set of information required to generate a result. This will

happen when votes from several independently managed areas must be amalgamated to

- 780 produce a result.
- 781 The reporting unit identifier structure defines a string with an optional Id.

5.2.41 ResponsibleOfficerStructure

783

Element	Attribute	Туре	Use	Comment
ResponsibleOfficerStructure	ld	xs:NMTOKEN	optional	

784 A responsible officer is someone who has some sort of rôle to play in the organization of an 785 election. Each responsible officer has a name and/or responsibility (such as 'returning officer')

786 and optional contact information. Local rules will usually indicate the values allowed in the

787 Responsibility element.

5.2.42 ScrutinyRequirementStructure 788

789 The ScrutinyRequirementStructure is an extension of xs:token to add the following 790 attribute:

Element	Attribute	Туре	Use	Comment
ScrutinyRequirementStructure	Туре	xs:token	required	

791 A scrutiny requirement has two parts, a Type attribute and a text value. The Type specifies a 792 condition that a candidate must meet, such as an age or membership requirement or the payment 793 of a fee. The text describes how that condition has been met. For example:

<ScrutinyRequirement Type="dateofbirth">8 June 796 1955</ScrutinyRequirement> 797

798

5.2.43 SealStructure

799

•							
	Element	Attribute	Туре	Use	Comment		
	OtherSeal	Туре	xs:token	required			

800 The seal is used to protect information such as a vote, voting token or complete message. The

801 seal provides the means of proving that no alterations have been made to a message or

802 individual parts of a message such as a vote or collection of votes, from when they were originally

⁷⁹⁴ 795

- 803 created by the voter. The seal may also be used to authenticate the identity of the system that 804 collected a vote, and provide proof of the time at which the vote was cast.
- 604 collected a vote, and provide proof of the time at which the vote was cast.
- 805 If a message is to be divided, each part must be separately sealed to protect the integrity of the
 806 data. For example, if votes in several elections are entered on a single ballot, and these votes are
 807 being counted in separate locations, each vote must be separately sealed.
- 808 A seal may be any structure which provides the required integrity characteristics, including an
- 809 XML signature [1] or a time-stamp.
- 810 The XML signature created by the voting system provides integrity and authentication of the
- 811 identity of the system that collected the vote. The time-stamp provides integrity of the vote and
- 812 proof of the time that the vote was cast.

813 **5.2.44 SimpleDateRangeStructure**

- 814
- 815 This data type is used to describe ranges of dates or dates and times.

816

5.2.45 TelephoneStructure

817

Element	Attribute	Туре	Use	Comment
TelephoneStructure	Preferred	YesNoType	optional	
	Mobile	YesNoType	optional	

818 This is an extension of the TelephoneType and adds an Extension element and the two

819 attributes Preferred and Mobile of YesNoType. The Preferred attribute indicates which of 820 several phone numbers or fax numbers is preferred.

5.2.46 VoterIdentificationStructure

822

* • •				
Element	Attribute	Туре	Use	Comment
VoterIdentificationStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
ld	Туре	xs:token	required	

An element defined by this data type is used wherever identification of a voter is required. It contains the voter's name and electoral address (the address that gives them the right to vote in a specific contest), the voting token (either normal or qualified) and a number of identifiers (such as an electoral registration number). It may also include a previous electoral address if this is

required (for example, because a voter has not been at his or her current address for more than a predefined period).

5.2.47 VoterInformationStructure

Generated with XMLSpy Schema Editor www.xmlspy.com

Element	Attribute	Туре	Use	Comment
VoterInformationStructure	ld	xs:NMTOKEN	optional	
	DisplayOrder	xs:positiveInteger	optional	
ContactDetailsStructure	DisplayOrder	xs:positiveInteger	optional	standard attribute for this data type
	ElectionId	xs:NMTOKEN	optional	additional attribute
PreferredChannel	Fixed	YesNoType	optional	
Checkbox	Туре	xs:token	required	

This contains more information about the voter. It contains all the information that would typically be included on an electoral register other than that used for identification of the voter. In many

cases, it will be restricted to only include the information required in a specific message type.

836 A voter can list his or her preferred voting channels. These are listed in order of preference for a

given period (which may be specific election events, a date range or permanent), so that

838 information can be sent regarding the most appropriate voting channel at any election. The

839 channel may be fixed, for example, if registering to vote by a specific channel prevents voting by

840 other means.

The Qualifier element is used to hold information that might affect a voter's right to vote or how the voting process is managed. Suitable enumerations for this are likely to be added as part of localisation. The CheckBox element with its Type attribute allows binary information such as whether the voter's entry on the electoral register can be sold, or whether the voter wants to participate in the count. The eligibility indicates what election types a voter is eligible to participate

. 846 in.

Special requests are requests from the voter, for example, for wheelchair access to a pollingstation.

1.....

Component

849 5.2.48 VTokenStructure

VTokenStructure 😑

850

Element	Attribute	Туре	Use	Comment
Component	Туре	xs:NMTOKEN	required	

-{any **##other**}

The voting token contains the information required to authenticate the voter's right to vote in a specific election or contest. A voting token can consist of a continuous string of encoded or encrypted data, alternatively it may be constructed from several data components that a user may input at various stages during the voting process (such as PIN, password and other coded data elements). The totality of the voting token data proves that a person with the right to vote in the specific election has cast the vote.

B57 Depending on the type of election, the voter may need to cast their votes anonymously, thus not providing a link to the voter's true identity. In this case the voting token data will not identify the actual person casting the vote; it just proves that the vote was cast by a person with the right to do so. Election rules may require a link to be maintained between a vote and a voter, in which case a link is maintained between the voting token data and the voter's identity.

The components of the voting token are identified by a Type attribute and may contain text or markup from any namespace depending on the token type. The content could be defined further in separate schemas for specific types of token.

865

5.2.49 VTokenQualifiedStructure

866

Element	Attribute	Туре	Use	Comment
Reason	Туре	xs:token	required	

867 There are occasions when a normal voting token cannot be used. For example, if a voter is

868 challenged, or an election officer claims the voter has already voted. In these circumstances a

qualified voting token can be used and treated appropriately by the election system according to

the election rules. For example, challenged votes might be ignored unless there were sufficient to

- 871 alter the result of the election, in which case each vote would be investigated and counted if
- 872 deemed correct to do so.
- 873 The VTokenQualifiedStructure is therefore an extension of the VTokenStructure to add
- the additional information required. This additional information comprises a reason for
- 875 qualification (as a Reason element with a Type attribute and textual description) and possibly an
- 876 original VToken.

877 **5.3 Elements**

878 The following elements are simply specified by their similarly-named data type and are not 879 described further here:

880 Affiliation, AffiliationIdentifier, Agent, AgentIdentifier, Area,

881 AuditInformation, AuthorityIdentifier, BallotIdentifier,

- 882 BallotIdentifierRange, Candidate, CandidateIdentifier, ContactDetails,
- 883 ContestIdentifier, CountingAlgorithm, DocumentIdentifier,
- 884 ElectionIdentifier, EventIdentifier, EventQualifier, Gender, Logo,
- 885 ManagingAuthority, MessageType, NominatingOfficer, NumberOfPositions,
- 886 Period, PollingDistrict, PollingPlace, Position, Proposal,
- 887 ProposalIdentifier, Proposer, Proxy, ReferendumOptionIdentifier,
- 888 ReportingUnitIdentifier, ResponsibleOfficer, ScrutinyRequirement, Seal,
 889 VToken, VTokenQualified

890 **5.3.1 Accepted**

- 891 YesNoType
- 892 This element indicates that a candidate, referendum proposal or vote has been accepted.
- 893 5.3.2 Election Statement
- 894 MessagesStructure
- 895 This is the candidate's message to voters.
- 896 **5.3.3 MaxVotes**
- 897 xs:positiveInteger
- 898 The maximum number of votes allowed (also known as the vote limit). This defaults to the value 899 of "1".
- 900 **5.3.4 MinVotes**
- 901 xs:nonNegativeInteger
- 902 The minimum number of votes allowed. This defaults to the value of "0".
- 903 5.3.5 NumberInSequence
- 904 xs:positiveInteger
- 905 The number of partial messages when a message is split. See "Spitting of Messages"

906 5.3.6 NumberOfSequence

- 907 This element represents the number of identical positions that will be elected as the result of a 908 contest. For example, in a contest for a Town Council, three councillors might be elected as the 909 result of the contest in one part of the town. The element is an xs:positiveInteger and 910 defaults to a value of "1".
- 911 **5.3.7 PersonName**
- 912 This element uses the PersonNameStructure defined in the EML externals schema.

913 **5.3.8 Profile**

914 MessagesStructure

915 This is the candidate's profile statement.

916 **5.3.9 SequenceNumber**

- 917 xs:positiveInteger
- 918 The sequence number of a partial message when a message is split. See "Splitting of
- 919 Messages".

920 5.3.10 TransactionId

- 921 xs:token
- 922 A reference code for a specific transaction, which may comprise several messages.

923 **5.3.11 VoterName**

- 924 PersonNameStructure
- 925 The name of a voter.

926 6 The EML Message Schemas

- 927 This section describes the EML messages and how the message specifications change for this
- 928 application. It uses the element and attribute names from the schemas.
- 929 Attributes are shown where they are not the standard attributes of data types already described.

930 6.1 Election Event (110)

Element	Attribute	Туре	Use	Comment
AllowedChannels	DisplayOrder	xs:positiveInteger	optional	
Contest	DisplayOrder	xs:positiveInteger	optional	

933

6.1.1 Description of Schema

This schema is used for messages providing information about an election or set of elections. It is
usually used to communicate information from the election organisers to those providing the
election service.

937 The message therefore provides information about the election event, all elections within that 938 event and all contests for each election.

939 For the election event, the information includes the ID and name of the event, possibly with a

940 qualifier on the event. This qualifier is used when an event has several local organisers. For

941 example, for a UK general election, each constituency organises its own contests. The election 942 event is therefore the general election, whilst the qualifier would indicate the constituency. Other

- 942 event is therefore the general election, whilst the qualifier would indicate the constituency. Othe943 information regarding an election event comprises the languages to be used, the start and end
- dates of the event, potentially a list of external documents that are applicable (such as the rules
 governing the election), a description and information about the managing authority.
- 946 The managing authority can be indicated for the event, each election, each contest within the 947 election and each reporting unit.
- 948 An election can have a number of dates associated with it. For example, there is likely to be a
- 949 period allowed for nomination of candidates and a date when the list of eligible voters is fixed.
- Each date can be expressed as a single date when something happens, a start date, an end
 date, or both start and end dates. These dates can be either just a date or both a date and time
- using the subset of the ISO 8601 format supported by XML Schema.
- Like the event, an election can have both a managing authority and referenced documents.
 Finally, there is a Messages element for additional information.
- A contest has a name and ID. It can also have reporting unit identifiers. A contest may need to specify its geographical area independently from its name, for which purpose the Area element is
- 957 provided. Each contest can specify the voting channels allowed. In general, the list of possible
- 958 channels will be further restricted as part of a local customisation. Each channel can specify
- several methods for authenticating the voter, such as PIN and password, and a response
 method, indicating the type of response to be given to a cast vote. Finally, facilities are provided
- 961 to indicate the dates and times when the channel will be available to the voter.
- 962 As described previously, a contest can indicate its managing authority. It may also indicate the
- 963 position (such as 'President') for which votes are being cast. The Description allows for
- additional text describing the contest. Each contest indicates the voting method being used, whilst
- 965 the CountingAlgorithm indicates the method of counting (such as the d'Hondt or Meeks 966 method) that will be used. The minimum and maximum number of votes to be cast by each voter
- 967 can also be indicated.
- 968 A list of polling places can be provided. These can be either physical locations for people to go to
- 969 vote, postal addresses for postal votes or electronic locations. An 'other location' is also allowed
- 970 for cases where these do not meet the requirements. A location can also say when it will be
- available. This is intended for mobile polling stations that will only be available at a given addressfor a part of the voting period.
- 973 Finally, a Messages element allows for additional information that might be communicated to the 974 voter later through other messages.

6.1.2 EML Additional Rules

Error Code	Error Description
3110-001	The allowed channels must not be declared at both the election event level and the contest level.

976 **6.2 Inter Database (120)**

977

978

6.2.1 Description of Schema

This schema is used for messages requesting services from other electoral registers or candidate databases. This can, for example, be used to de-dupe databases, check that a candidate in an election is only standing in one contest or confirm that the proposers of a candidate are included on a relevant electoral register. The schema is in two parts, so a message will be either a request or a response.

984 Both request and response start by identifying the source and destination as processing units.

985 A request has an Action code to identify the request being made. Possible actions include, but

986 are not limited to, 'add', 'delete', 'replace', 'confirm' and 'return'. The code 'confirm' returns

987 success if the person indicated is included in the database. The code 'return' causes the

988 receiving the database to return the full information for the person identified. The

- 989 ActionDateTime is used to specify when the action should be carried out, and then there is an 990 optional list of voters or candidates.
- 991 A response has a similar structure. It could be that the Action code is no longer required, so this
- 992 is now optional. The TransactionID must match that given in the request. The Result is either
- 993 a binary Success flag or a remark or both. Again, there is a date and time, but in this case it is
- 994 the date and time at which the action took place.

6.3 Response (130) 995

996

997

6.3.1 Description of Schema

998 Some messages have a defined response message that provides useful information. However, 999 there is a need for a more general response, either to indicate that a message has been 1000 accepted, or to indicate the reasons for rejection.

The message includes information to identify the message to which the response applies (by 1001 1002 using the same transaction id in the EML element and, if necessary, including the sequence

- 1003 number of the message to which the response applies in the Response element), with
- information on the entity raising the message, whether the message was accepted and 1004
- 1005 information about the errors if it was not. The desired language for a display message can also be 1006 included to allow a downstream processor to substitute a language-specific error message if 1007 required.
- 1008 If the message is reporting an error, the location of the error within the message can be indicated. 1009 Usually, this will be an XPath to the location of the error. However, errors detected by an XML
- 1010 parser may be in a different format, such as a line number.
- Note that a single response can be raised for a series of sub-messages with the same transaction 1011

1013 6.3.2 Additional EML Rules

Error Code	Error Description
3130-001	If the message is not accepted, there must be an Errors element

1015

1016

6.4.1 Description of Schema

- 1017 Messages conforming to this schema are used for four purposes:
- 1018 1. nominating candidates in an election;
- 1019 2. nominating parties in an election;
- 1020 3. consenting to be nominated; or
- 1021 4. withdrawing a nomination.
- 1022 Candidate consent can be combined in a single message with a nomination of the candidate or 1023 party or sent separately.
- 1024 Note that the message does not cover nomination for referendums.

1025 The election and contest must be specified. When a candidate is being nominated, there must be 1026 information about the candidate and one or more proposers. The candidate must supply a name. 1027 Optionally, the candidate can provide contact information, an affiliation (e.g. a political party) and 1028 textual profiles and election statements. These two items use the MessagesStructure to allow 1029 text in multiple languages. There is also scope to add additional information defined by the 1030 election organiser.

- 1031 The proposers use the standard proposer declaration with a mandatory name and optional
- 1032 contact information and job title. Again, additional information can be required.
- 1033 If a party is being nominated, the primary proposer will be the contact. Information on candidates 1034 in a party list can also be provided.

1035 Candidates, either individuals or on a party list, must define the action being taken and may

1036 provide scrutiny information. The scrutiny requirements indicate how the candidate has met any

1037 conditions for standing in this election. This could include indicating that a deposit has been paid

1038 or providing a reference to prove that he or she lives in the appropriate area. This information can

1039 be signed independently of the complete message.

1040 6.5 Response to Nomination (220)

1041

1042

6.5.1 Description of Schema

1043 This message is sent from the election organiser to the candidate or nomination authority for a 1044 party to say whether the nomination has been accepted. Along with the acceptance information 1045 and the basic information of election, contest and party and candidate names, the candidate's 1046 contact details and affiliation can be included and a remark explaining the decision.

1047 6.5.2 EML Additional Rules

Error Code	Error Description
3220-001	If the nomination has not been accepted, a reason for rejection is required in the Remark element

1049 6.6 Candidate List (230)

1051

1050

6.6.1 Description of Schema

This schema is used for messages transferring candidate lists for specified contests. It has the
election event, election and contest identifiers, and optionally the event dates and a contest
description. The list itself can be either a list of candidates, each with a name, address, optional
affiliation and other useful data, or a list of parties. In the latter case, contact information and a list
of candidates under a party list system can also be included.

6.7 Voter Registration (310) 1057

1058

1059

1065

6.7.1 Description of Schema

- 1060 This schema is used for messages registering voters. It uses the
- 1061 VoterIdentificationStructure. The VoterInformationStructure is used unchanged.
- Proof of ID can be provided. 1062
- There is the facility for the transmission channel (for example a trusted web site) to add the time 1063
- 1064 of transmission.

6.7.2 EML Additional Rules

Error Code	Error Description
3310-001	The Proxy must not have a VToken or VTokenQualified

Element	Attribute	Туре	Use	Comment
Blocked	Reason	xs:token	optional	
	Channel	VotingChannelType	optional	

1068 **6.8.1 Description of Schema**

1069 This schema is primarily used for messages communicating the list of eligible voters for an 1070 election or set of elections. It can also be used for any other purpose that involves the transfer of 1071 voter information where the 120-interDB message is not appropriate. Partial lists are allowed 1072 through the use of the Qualifier, Blocked and VoterGroup elements. So, for example, a list 1073 of postal voters or a list of proxies can be produced. 1074 For each voter, information is provided about the voter himself or herself, and optionally about the 1075 elections and contests in which the voter can participate. The information about the voter is the 1076 same as that defined in the 310-voterregistration schema. Added to this can be a list of elections, 1077 each identifying the election and the contest in which this voter is eligible to vote, and the polling 1078 places available. Any voter can have a Blocked element set against them with an optional 1079 Reason and Channel. This allows a list to be produced for a polling place indicating those that have already voted by another means or who have registered for a postal vote. It can also be 1080 1081 used if the complete electoral register must be transmitted (perhaps as a fraud prevention 1082 measure) but some people on the register are no longer eligible to vote.

10836.8.2 EML Additional Rules

Error Code	Error Description
3330-002	The polling district can only be included for either the voter or the election.
3330-003	The polling place can only be included for either the voter or the election.

6.9 Polling Information (340)

1087

1089

Element	Attribute	Туре	Use	Comment
BallotChoices	Contested	YesNoType	optional	
VotingPeriod	DisplayOrder	xs:positiveInteger		
VotingInformation	DisplayOrder	xs:positiveInteger	optional	
	Channel	VotingChannelType	optional	

1090

6.9.1 Description of Schema

1091 The polling information message defined by this schema is sent to a voter to provide details of 1092 how to vote. It can also be sent to a distributor, so multiple sets of information are allowed. In the 1093 case of SMS voting, ballot information may also be required, so this can be included. Either one 1094 or several sets of polling information may be sent to each voter for any election event.

1095 Some information about the voter and any proxy may be included, for example to print on a 1096 polling card. This can also include a mailing address for a distributor to use.

1097 Information about the elections and contests is included for the benefit of the voter. For each

voting channel, this includes where to vote (which could be a polling station, address for postal

1099 voting, URL for Internet voting, phone number for SMS voting etc) and the times that votes can

1100 be placed. Use of the DisplayOrder attribute on these allows the display or printing of

1101 information to be tailored from within the XML message.

- 1102 Ballot information may be included if required. This is a subset of the information defined in the
- 1103 410-ballots schema. In this case, it is likely that the short code for a candidate will be used for
- 1104 SMS voting. It is possible that an expected response code will be provided as well. Both the short 1105 code and expected response code may be tailored to the individual voter as part of a security
- 1105 code and expected response code may be failored to the individ 1106 mechanism.

6.10 Outgoing Generic Communication (350a)

1108

6.10.1 Description of Schema 1109

This schema provides a common structure for communications to the voter. Individual message 1110 types can be designed based on extensions of this schema. 1111

1112 The voter must always provide a name and might provide one or more identifiers. These are

1113 shown as a restriction of the VoterIdentificationStructure, the restriction being to leave

1114 out the VToken and VTokenQualified. Contact details are also required, and it is expected that 1115 at least one of the allowed contact methods will be included. Inclusion of proxy information is

optional. 1116

1117 The identifiers for the election event, election and contest are optional. There is then an element

1118 in which a message can be placed in any of several different formats according to the channel 1119 being used.

6.11 Incoming Generic Communication (350b)

1121

1122

6.11.1 Description of Schema

1123 This schema provides a common structure for communications from the voter. Individual 1124 message types can be designed based on extensions of this schema.

1125 The voter's name must be provided and there can be one or more identifiers. These are shown 1126 as a restriction of the VoterIdentificationStructure, the restriction being to leave out the VToken and VTokenQualified. Contact details are also required, and it is expected that at least 1127 1128 one of the allowed contact methods will be included. Inclusion of proxy information is optional.

1129 The identifiers for the election event, election and contest are optional. There is then an element in which a message can be placed in any of several different formats according to the channel 1130 being used.

1131 1132

1133 6.12 Internal Generic (350c)

1134

1135 **6.12.1 Description of Schema**

This schema provides a common structure for communications between those involved in
organizing an election. Individual message types can be designed based on extensions of this
schema.

1139 There are optional To and From elements, which can contain any EML elements. It is expected 1140 that these will usually be a responsible officer or a person's name and contact information.

1141 The identifiers for the election event, election and contest are optional. There is then an element 1142 in which a message can be placed in any of several different formats according to the channel

1143 being used.

1144 6.13 Outgoing Channel Options (360a)

1145

1146 **6.13.1 Description of Schema**

1147 This schema is used for messages offering a set of voting channels to the voter. It is an extension

of schema 350a. A message conforming to this schema will include a list of allowed channels,

1149 either to request general preferences or for a specific election event or election within the event.

6.14 Incoming Channel Options (360b) 1150

1151

6.14.1 Description of Schema 1152

- 1153 This schema is used for messages indicating one or more preferred voting channels. It may be sent in response to 360a or as an unsolicited message if this is supported within the relevant 1154
- 1155 jurisdiction.
- 1156 It is an extension of schema 350b, and indicates a preferred voting channels in order of 1157 preference.
1158 **6.15 Ballots (410)**

Element	Attribute	Туре	Use	Comment
Contest	DisplayOrder	xs:positiveInteger	optional	
	Completed	YesNoType	optional	
Qualified	Reason	xs:token	required	
Blocked	Reason	xs:token	optional	
	Channel	VotingChannelType	optional	

BallotChoices	Contested	YesNoType	optional	
---------------	-----------	-----------	----------	--

6.15.1 Description of Schema

- 1164 This schema is used for messages presenting the ballot to the voter or providing a distributor with 1165 the information required to print or display multiple ballots.
- In the simplest case, a distributor can be sent information about the election event and a ballot IDto indicate the ballot to print.
- 1168 In other cases, the full information about the elections will be sent with either an election rule ID to
- identify the voters to whom that election applies or a set of voter names and contact information.If the ballot is being sent directly to the voter, this information is not required. Since printed ballot
- 1171 papers are likely to require a unique identifier printed on them, the range to be used for each
- 1172 ballot type can be defined.
- 1173 The election information starts with the election identifier and description. This is followed by
- information related to the contest and any other messages and information required. Note that
 each voter can only vote in a single contest per election, so only a single iteration of the Contest
 element is required.
- 1177 A contest must have its identifier and a list of choices for which the voter can vote. A voter can
- 1178 vote for a candidate, an affiliation (possibly with a list of candidates) or a referendum proposal.
- 1179 There is also a set of optional information that will be required in some circumstances. Some of
- 1180 this is for display to the voter (HowToVote and Messages) and some controls the ballot and
- 1181 voting process (Rotation, VotingMethod, MaxVotes, MinVotes, MaxWriteIn).

1182 **6.16 Authentication (420)**

1183

1184 **6.16.1 Description of Schema**

1185 The authentication message defined by this schema may be used to authenticate a user during the voting process. Depending on the type of election, a voter's authentication may be required. 1186 1187 The precise mechanism used may be channel and implementation specific, and can be indicated 1188 using the LoginMethod element. In some public elections the voter must be anonymous, in 1189 which case the prime method used for authentication is the voting token. The voting token can 1190 contain the information required to authenticate the voter's right to vote in a specific election or 1191 contest, without revealing the identity of the person voting. Either the VToken or the 1192 VTokenQualified must always be present in an authenticated message. The VotingChannel 1193 identifies the channel by which the voter has been authenticated.

1194 6.17 Authentication Response (430)

1195

Element	Attribute	Туре	Use	Comment
Contest	DisplayOrder	xs:positiveInteger	optional	
	Completed	YesNoType	optional	
Qualified	Reason	xs:token	required	
Blocked	Reason	xs:token	optional	
	Channel	VotingChannelType	optional	
BallotChoices	Contested	YesNoType	optional	

1196 6.17.1 Description of Schema

1197 The authentication response is a response to message 420. It indicates whether authentication

1198 succeeded using the Authenticated element, and might also present the ballot to the user.

1199 This is a restriction of the Ballots element to allow only a single ballot per reply.

1200 6.18 Cast Vote (440)

Element	Attribute	Туре	Use	Comment
CastVote	Spoilt	xs:token	optional	
Contest	Spoilt	xs:token	optional	
Selection	Value	VotingValueType	optional	
	ShortCode	ShortCodeType	optional	
Candidate	Value	VotingValueType	optional	

1201

6.18.1 Description of Schema

1202 This message represents a cast vote, which comprises an optional voting token (which may be 1203 qualified) to ensure that the vote is being cast by an authorized voter, information about the 1204 election event, each election within the event and the vote or votes being cast in each election, an 1205 optional reference to the ballot used, the identifier of the reporting unit if applicable and a set of 1206 optional audit information.

For each election, the contest is identified, with a set of, possibly sealed, votes. The votes are
sealed at this level if there is a chance that the message will be divided, for example so that votes
in different elections can be counted in different locations.

1210 The selection of candidates, affiliations or a referendum option uses the Selection element. If

1211 an election requires preferences to be expressed between candidates, multiple Selection

1212 elements will be used, each of these having a suitable Value attribute. Some elections allow

1213 write-in candidates, and these are handled in a similar way. Preferences can also be expressed

1214 between parties, using the Affiliation element. The PersonalIdentifier is used in

1215 elections where each voter is given an individual list of codes to indicate their selection.

1216 A more complex election might request the voter to vote for a party, then express a preferences

1217 of candidates within the party. In this case, the Affiliation element is used to indicate the

1218 party selected, and multiple CandidateIdentifier elements, each with a Value attribute are 1219 used to express candidate preferences.

1220 Preferences in a referendum are handled in the same way as they are for candidates and parties,

1221 using the ReferendumOptionIdentifier.

1224 6.19.1 Description of Schema

1225 This message is used for voting systems that include a pre-ballot box from which votes can be 1226 retrieved and amended before being counted. When a vote is retrieved, it should be deleted from

1227 the pre-ballot box.

1228 **6.20 Vote Confirmation (450)**

1229

1230 6.20.1 Description of Schema

1231 The vote confirmation message can be used to show whether a vote has been accepted and 1232 provide a reference number in case of future queries. Some voting mechanisms require multiple 1233 ConfirmationReference elements. If the vote is rejected, the Remark element can be used to 1234 show a reason.

1235

1237 See 440-CastVote for the detail of the CastVoteStructure.

Element	Attribute	Туре	Use	Comment
CastVote	Spoilt	xs:token	optional	
Contest	Spoilt	xs:token	optional	
Selection	Value	VotingValueType	optional	
	ShortCode	ShortCodeType	optional	
Candidate	Value	VotingValueType	optional	
ProposedRejection	Reason	xs:token	optional

	Objection	YesNoType	optional	
ProposedUncounted	Reason	xs:token	optional	
	ReasonCode	xs:token	required	

Objection	YesNoType	optional	
-----------	-----------	----------	--

6.21.1 Description of Schema

1239 This schema is used to define a message comprising a set of votes being transferred for 1240 counting. It is a set of CastVote elements from schema 440 with the addition of the 1241 ProposedRejection and ProposedUncounted elements and audit information for the voting 1242 system. If a vote is rejected, for example, because a voter has chosen to spoil a ballot paper, 1243 many authorities will want to count that vote as having been cast. The UncountedVotes element 1244 is reserved for those cases where that record is not required, for example when the result is 1245 thought to be fraudulent. A ProposedRejection or ProposedUncounted element must have a 1246 ReasonCode attribute, and may have a Reason attribute to describe the code. They may also 1247 have an Objection attribute. This indicates that someone has objected to this vote being 1248 rejected or the proposal that it should not be counted.

4	0E0	
н	2711	
	200	

Element	Attribute	Туре	Use	Comment
VToken	Status	xs:token (restricted)	required	
VTokenQualified	Status	xs:token (restricted)	required	

6.22.1 Description of Schema

1252 The message defined by this schema is used to add voting tokens (which may be qualified) to an 1253 audit log. The VToken or VTokenQualified is extended by the addition of a Status attribute 1254 with a value of voted or unvoted for the VToken and voted, unvoted and withdrawn for the VTokenQualified. In addition to sending single tokens as they are used, the schema can be 1255 1256 used to validate a message sending multiple tokens optionally grouped by voting channel. This 1257 might be used instead of sending tokens as they used or, for example, to send the unused tokens 1258 at the end of an election. The Update element can be used to indicate that an existing log is 1259 being updated rather than the message containing a complete new log. The logging system can 1260 also be identified for audit purposes.

1261 **6.23 Audit Log (480)**

1264

6.23.1 Description of Schema

1265 The message defined by this schema is used to log the use of each seal with associated 1266 information for audit purposes.

1267 An audit log message can be transmitted individually as the message causing the log entry is

1268 sent or received, or the logs can be stored, and several seals logged at once. Ideally, every

1269 device that can create or consume a message will create a log entry so that pairs of entries can

be matched. The most important messages to log are those associated with the voting processitself, and these are shown below.

1272 When used in this message, the Response element will not have an AuditInformation child.

				Vtoken	Seal		
Originating		Voting	Counting	Logging	Logging		
Device	Gateway	System	System	System	System	Other	Notes
130							4
410 next receiver	receiver	sender					
420 previous sender	sender	receiver					
430 next receiver	receiver	sender				sender / receiver	3
440 previous sender	sender	receiver					
445 previous sender	sender	receiver					
450 next receiver	receiver	sender					
460		sender	receiver				
470		sender	sender	receiver		sender	
480 sender	sender	sender	sender	sender	receiver	sender	2
510			sender			receiver	
520			sender			sender / receiver	

Notes:

- **1.** In some cases (e.g. a kiosk) there may be no gateway involved. In this case, the values in the Gateway column apply to the Originating Device.
- **2.** Creators and receivers of 480 (audit log) messages may not be required to log the seals. In particlar, if an adit log message is sent per seal created or received, the seal on the 480 message must not be logged.
- **3** "Other" may be the sender when the message is sent to a printer. In this case, the receiver will also be an "Other".
- **4.** An audit log should only be created when the message is used to communicate an error. Most devices can send or receive 130 messages.

1273

The message may contain the name and ID of the event, election and contest. It can also indicate
whether this is an update to an existing log or a new log. Following the logged seals, a text
message can be added as well as audit information for the audit logging message itself.

1277 Each seal being logged must indicate whether the device sending the log was the sender or 1278 receiver of the sealed message. It may be accompanied by the voting token associated with the 1279 seal and possibly additional audit information. This will be the audit information from the message 1280 being logged with additional information about the message. Most of this is common to all 1281 message types, but some message types require specific audit information. One of these is the 1282 130-response message. When this is used to convey an error, almost the complete message 1283 payload (the Response element and its contents apart from the audit information) is logged with

1284 the usual message-independent data.

Element	Attribute	Туре	Use	Comment
Selection	Value	VotingValueType	optional	
RejectedVotes	Reason	xs:token	optional	
	ReasonCode	xs:token	required	
UncountedVotes	Reason	xs:token	optional	
	ReasonCode	xs:token	required	

6.24.1 Description of Schema

1288

1289 The count message defined by this schema is used to communicate the results of one or more 1290 contests that make up one or more elections within an election event. It may also be used to 1291 communicate the count of a single reporting unit for amalgamation into a complete count.
1292 The message includes the election event identifier, and for each election, the election identifier, 1293 an optional reference to the election rule being used and information concerning the set of 1294 contests.

1295 In some cases, reporting for a contest may be required at a lower level (for example, for each 1296 county in a state). For this reason, reporting may be done at the level of the reporting unit, the 1297 total votes, or for a total vote and the breakdown according to the multiple reporting units.

Each contest indicates its identifier, and optionally the counting system and the maximum number of votes that each voter could cast. The key information is that about the votes cast for each of the choices available and the numbers of abstentions and rejected and uncounted votes. If a vote is rejected, for example, because a voter has chosen to spoil a ballot paper, many authorities will want to count that vote as having been cast. The UncountedVotes element is reserved for those cases where that record is not required, for example when the result is thought to be fraudulent.

cases where that record is not required, for example when the result is thought to be fraudulent.
 Both the UncountedVotes and RejectedVotes elements have Reason (optional) and

1305 ReasonCode (mandatory) attributes to indicate why the votes were treated as they have been.

1306 The former is a textual description, and the latter a code.

1307 For each choice available to the voter, the identifier and number of valid votes are mandatory.

1308 The other information provided depends on the type of election. For example, the Value attribute

1309 of the Selection element can be used to indicate whether a candidate was a first or second

1310 choice in an election run under the single transferable vote system. In the simplest cases, the 1311 identifier for the candidate (perhaps with the party), the party or the referendum option are given.

identifier for the candidate (perhaps with the party), the party or the referendum option are given.If the voter was able to vote for a party and provide a preference for candidates within the party,

1313 the AffiliationIdentifier element is used, and multiple CandidateIdentifier elements

1314 may be used, each with a Count attribute. This count is the result of whatever algorithm has been

1315 used to calculate the ranking of the candidates.

1316 **6.25 Result (520)**

1318 6.25.1 Description of Schema

Messages described by this schema can be used to communicate the results of simple election
 types. One specific use is to provide an input into the calculation algorithm for elections using the
 additional member system.

The main part of the schema is held within the Selection element. This allows a choice of candidate, affiliation or referendum option identifiers to be defined with the position that choice achieved (first, second etc). Optionally, the number of votes can be shown. A candidate can be associated with his or her affiliation if required. Write in candidates will be shown in the same way as other candidates, although they will only have an Id attribute if this is assigned in the election system after the votes are cast.

1328 **6.26 Options Nomination (610)**

1329

1330 6.26.1 Description of Schema

This schema is used to submit proposals, for example for a referendum or company AGM. It uses
the generic Proposal element to define the proposal itself. One of more proposers can be named
and may sign the nomination.

13346.27 Options Nomination Response (620)

1335

13366.27.1 Description of Schema

This message is sent from the election organiser to the proposer to say whether the nomination
has been accepted. Along with the acceptance information and the basic information of election,
contest and identifier for the proposal, a remark can be made explaining the decision.

1340

6.27.2 EML Additional Rules

Error Code	Error Description
3620-001	If the nomination has not been accepted, a reason for rejection is required in the Remark element

1342 6.28 Options List (630)

1343

1344 6.28.1 Description of Schema

1345 This schema is used for messages transferring lists of proposals for a referendum. It may identify 1346 the election event, and provides details about the election. Each proposal in a referendum counts

1347 as an election, so each election identified will hold a single proposal.
